

We at Aero Mock-Ups take the well-being of our staff and clients as a top priority. We're employing the latest sanitizing method inspired by aviation technology for Covid-19 safety procedures and following CDC & AMPTP guidelines for everyone's safety.

Enhanced Set Cleaning

Designed to sanitize our airplane and terminal sets, Aero Mock-Ups' Germ Buster uses the cleansing effects of UVC light to disinfect even hard-to-reach areas. Our sets are sanitized with UVC light before each is shipped and before the start of production at Aero Mock-Ups, and again upon a set's return and at completion of filming at our facility.

The premise behind disinfecting with UVC light is that the source has to be as close as possible to the target of infection, have enough intensity, for enough time to inactivate the virus. Though no one yet knows the right dose to kill the Covid-19 virus (SARS-CoV-2), other viruses in the same SARS virus family are susceptible to UVC light at around 15 mJ/cm². At one minute on target, our Germ Buster generates **28.4 mJ/cm²**.

Handwashing

Handwashing facilities are located throughout the Aero Mock-Ups property, including soundstages, offices, and parking lot.

Health Check-Ins

We at Aero Mock-Ups complete health survey questions and temperature checks at the start of our day to help monitor health status. For those filming at our facility, we offer the same procedures and supplies upon request.

Facial Coverings

We encourage the use of facial coverings while working at Aero Mock-Ups. We also encourage the same practice for visitors and clients and, for your convenience, we will supply facial coverings upon request.

Social Distancing

We practice social distancing at our facility and encourage our clients to do the same whenever possible while filming at Aero Mock-Ups.
